

Southeastern Wisconsin Coastal Resilience Project

Building Hazard Resilience through Regional and Local Collaboration

Lake Michigan Water Level (1970 – 2019)

[illegible]

Southern Wisconsin
Coastal Communities Overview

The map displays the coastal regions of Southern Wisconsin, highlighting three counties: Milwaukee Co., Racine Co., and Kenosha Co. The map includes a legend indicating the following categories:

- Counties (Dark Blue)
- Cities (Light Blue)
- Towns (Green)
- Villages (Yellow)

Key locations labeled on the map include Mukwonago, Lake Geneva, Antioch, Winthrop Harbor, and various towns like Waukegan, Port Washington, and Oak Creek. An inset map shows the location of the study area within the state of Wisconsin.

Community of Practice

Semi-annual meetings for local government staff to discuss, share, and learn about coastal hazards, including:

- Invited speakers on desired topics
- Demonstrate decision-support tools
- Discussions about ongoing projects and potential collaboration
- Field trips to see hazard issues and potential solutions

Community of Practice

Coastal Resilience Boat Tours

- Staff from coastal local governments had opportunity to see coastline from the water
- Coastal engineering and geology specialists onboard to interpret sights and answer questions
- Facilitated conversation about coastal hazard issues and ways forward

Community of Practice

Lessons Learned

- Participants value the opportunity to interact with their peers and see how others are addressing similar issues
- Sharing a common experience like a field trip or boat tour can prompt thoughtful discussion
- A successful Community of Practice requires leadership from core individuals to bring the group together and facilitate meetings

Coastal Resilience Self-Assessment

Provide a starting point to identify opportunities to increase a community's resilience to coastal hazards

Climate Ready Infrastructure and Strategic Sites Protocol (CRISSP)

Municipalities in the Great Lakes Region are already experiencing the effects of climate change – from flooding, to extreme temperatures, to winter storms, to high winds, Great Lakes cities are at different stages of preparedness for extreme weather associated with climate change.

Through a collaboration with AECOM, the City of Gary and University of Michigan's Great Lakes Integrated Science and Assessment office (GLISA), the Cities Initiative has developed the *Climate Ready Infrastructure and Strategic Sites Protocol* (CRISSP), which relies on available data and municipal staff's own knowledge of their facilities and infrastructure to assess their assets' vulnerability to extreme weather in a way that is both relatively quick and low-cost.

The CRISSP guides your municipality through a step-by-step process to assemble your CRISSP team, gather relevant information on hazards and climate data, identify municipal infrastructure, facilities and sites located in extreme weather hazard zones, and perform a vulnerability assessment on them. A key aspect of the CRISSP is a helpful, easy to use Risk Matrix tool that takes users through a series of critical questions to assess the vulnerability of municipal facilities, sites or infrastructure.

To access the CRISSP and Risk Matrix, see the links below.

Coastal Resilience Self-Assessment

Series of yes/no questions to help identify common planning and mitigation actions to implement.

Shore Protection

Structural shore protection measures such as revetments, seawalls and groins are commonly used to protect property from flooding and erosion. To achieve the expected level of protection, these structures need to be monitored, maintained and replaced when necessary. Alternative hybrid-structural or non-structural practices may be considered due to cost, aesthetics, or adverse impacts to adjacent properties.

Shore Protection	Yes	No	?	Comments
23) Is the location of shore protection structures documented?	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	
24) Is the condition and expected effectiveness of shore protection structures documented?	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	
25) Is inspection and maintenance of shore protection structures performed routinely?	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	
26) Are you aware of instances where shore protection structures adversely impacted adjacent shorelines?	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Coastal Resilience Self-Assessment

Lessons Learned

- The self-assessment works best when completed by a team representing multiple departments in a municipality
- The self-assessment can serve as a catalyst to bring departments together around the issue
- A tool like this won't give “the answer” but it can start the conversation off in the right direction

Potentially Useful Flooding Assessment

Great Lakes and St. Lawrence Cities Initiative

Climate Ready Infrastructure and Strategic Sites Protocol (CRISSP)

A Simplified Method to Assess the Vulnerability of
Municipal Assets to Extreme Weather

June 2016

Sections:

- A. General Site Information
- B. Identify Risk Areas (Geographic –specific)
- C. Identify Risk from Other Hazards
- D. Immediate Hazard Event Response Capability
- E. Site-Specific Flood Risk Components
- F. Risk to Strategic Sites

Access CRISSP at: <https://glslcities.org/initiatives/municipal-climate-adaptation/crissp/>¹⁰

Summary

Regional Collaboration

A Community of Practice is a valuable framework for peers to learn about hazards and develop approaches to address them

Local Collaboration

Self-Assessment tools can be structured ways to bring different departments together to start conversations about hazard resilience

Resources for Coastal Communities

- [Adapting to a Changing Coast – Options and Resources for Lake Michigan Property Owners](#) – Publication with 16 options across 5 themes to help coastal property owners adapt to changing water levels and storms on Lake Michigan
- [Adapting to a Changing Coast – Options and Resources for Local Officials in Southeastern Wisconsin Coastal Communities](#) – Publication with 28 options across 4 themes to help local government officials address changing water levels and storms on Lake Michigan
- [Living on the Coast](#) – Booklet describing natural coastal processes and strategies to manage risk to coastal properties
- [Placing Erosion Control Structures on Great Lakes](#) – Website with information on requirements and considerations for shore protection projects in Wisconsin
- [Stabilizing Coastal Slopes on the Great Lakes](#) – Fact sheet describing shoreline erosion and slope instability
- [Working with Engineers and Contractors on Shore Protection Projects](#) – Fact sheet describing the process of finding and working with qualified coastal professional
- [Great Lakes Shore Protections Structures and Their Effects on Coastal Processes](#) – Fact sheet describing shore protection structures and their effects, both positive and negative, on the shoreline
- [Ohio Coastal Design Manual](#) – Online manual demonstrating how Great Lakes coastal structures are designed

Wisconsin Shoreline Inventory and Oblique Viewer

The Wisconsin Shoreline Inventory and Oblique Photo Viewer is a web-based, interactive map of Wisconsin coastal data that enables users to visualize the temporal changes to Wisconsin's shorelines. The inventory includes:

- Oblique aerial photos of Wisconsin's coast from 1976, 2008, 2012, 2017, and 2018
- A qualitative inventory of shoreline conditions (bluff condition & shoreline type) from 1976, 2008, and soon-to-be-added 2018.
